Significant Cost Savings

- Currently, most of the clear polyethylene is not protected from UV rays.
- Once the original corrugated box is ruined, the roll is then exposed to potential physical damages and environmental elements.
- The main destructive environmental element is sunlight, which breaks down the polyfilm very quickly, making it cloudy, brittle and unusable.
- Once the polyfilm has been exposed, it is ruined and ultimately wasted, and must be discarded.
- At an average current cost of \$90 for a 20 ft. x 100 ft. roll, this waste is very expensive.
- With the YPod Polyfilm Dispenser, the investment is protected.
